Welcome to the proceedings of the Power-Aware Computer Systems (PACS 2004)

workshop held in conjunction with the 37th Annual International Symposium on Microarchitecture (MICRO-37). The continued increase of power and energy dissipation in computer systems has resulted in higher cost, lower reliability, and reduced battery life in portable systems. Consequently, power and energy have become first-class constraints at all layers of modern computer systems. PACS 2004 is the fourth workshop in its series to explore techniques to reduce power and energy at all levels of computer systems and brings together academic and industry researchers. The papers in these proceedings span a wide spectrum of areas in power-aware systems. We have grouped the papers into the following categories: (1) microarchitecture- and circuit-level techniques, (2) power-aware memory and interconnect systems, and (3) frequency- and voltage-scaling techniques. The first paper in the microarchitecture group proposes banking and write-back filtering to reduce register file power. The second paper in this group optimizes both delay and power of the issue queue by packing two instructions in each issue queue entry and by memorizing upper-order bits of the wake-up tag. The third paper proposes bit slicing the datapath to exploit narrow width operations, and the last paper proposes to migrate application threads from one core to another in a multi-core chip to address thermal problems.
