Wireless 101 Oct 26 2020 Wireless 101 delivers the core technical knowledge needed by anyone serious in the wireless business today. A great deal of Wireless 101 is devoted to mobile communications, because one of the great things about wireless is you can move around while communicating, and people are willing to pay cold hard cash for it. If you added up all of the industry associated with mobile communications: everything from selling handsets and providing customer service, all of the people who work for the carrier, the trucks they buy, people getting jobs as riggers installing equipment on towers, the insurance they have to pay for – the mobile communications industry shows up as part of the gross domestic product of every country in the world. Bluetooth and Wi-Fi are now an indispensable part of everyday life including in-building Internet access and connecting your phone to your car as soon as you get close to it. In July 2022, Starlink was delivering download rates bursting up towards 1 Gb/s to remote areas for \$120 per month. This brings Broadband To The Remote Masses in one fell swoop, and will surely boost the quality of life and economic activity worldwide. So that's covered too. Part 1: Wireless Fundamentals The first part of Wireless 101 is Wireless Fundamentals, five chapters that set the foundation, with radio fundamentals and spectrum, how modems are used to move bits, and radio penetration, propagation and fading. Part 2: Mobile Communications The second part of Wireless 101 is Mobile Communications, fourteen chapters on mobility and mobile communications from A-Z, beginning with the ideas of cellular radio, handoffs, how PSTN phone calls ("Voice minutes") are implemented, and how Mobile Internet ("Data plan") is implemented. We'll explain the technologies: FDMA, TDMA, CDMA, OFDMA, the generations, and LTE and 5G New Radio, including millimeter-wave Ultra Broadband and low-bit-rate 5G services for IoT. Part 3: Fixed Wireless In the third part of Wireless 101, we'll cover other radio systems, primarily fixed wireless, where the question of continuous communications while driving down the highway doesn't come into play so much. We'll cover Wi-Fi: wireless LANs, standards and security, Bluetooth, broadband wireless home Internet, point-to-point, Low-Power Wide-Area Networks, and finish with satellite communications and Starlink.

*Use of Licensed and Unlicensed 2.4 and 5 GHz Bands in Developing Countries. Rwanda as a case study Oct 06 2021 Masterarbeit aus dem Jahr 2009 im Fachbereich Informationswissenschaften, Informationsmanagement, , Sprache: Deutsch, Abstract: In many countries, Spectrum Management has been under growing attention and debate in the last few years. Traditionally spectrum management has been largely based in a somewhat static approach, with allocations determined by the International Telecommunications Union (ITU), and national governments and telecommunication regulators responsible for spectrum assignment, monitoring and enforcement. In general, spectrum has been attributed on an exclusive basis, through a licensing regime. Recently several countries shifted towards different models, introducing different approaches such as spectrum pricing or trading, and exploring decentralized structures, such as the use of unlicensed bands. Currently, equipments based on unlicensed wireless technologies (WLAN, WiMax) are widely available commercially, inexpensive, and require little technical expertise for installation. Such equipment can be used to create data networks without investing time and money in acquiring a spectrum license or needing to depend on a telecommunications operator for use of the airwaves. Since on one hand the unlicensed spectrum and low-cost wireless technologies that operate in the 2.4 and 5 GHz bands is of particular value in that, it has the potential to substantially impact accessibility and availability of information and telecommunication services. And on other hand in the context of numerous institutional and structural obstacles that might occur to the entry of license-exempt, regulation provides a friendly environment for entrepreneurship while reducing any kind of barriers to the entry. This project aims to assess the opportunities for the 2.4 and 5 GHz bands in the context of developing countries, with a case study of Rwanda. In order to assess this opportunity in the context of Rwanda, I have surveyed every companies and institutions in the country on use of the 2.4 and 5 GHz bands.*

*Coexisting problems for wireless sensor networks working in 2.4 GHz frequency band Feb 22 2023 Document from the year 2019 in the subject Computer Science - Internet, New Technologies, , course: Wireless Sensor Networks, Home Area Networks, language: English, abstract: The objectives of this research are: To propose a scheme to estimate the future interference and enable efficient channel switching mechanism to avoid interference for Wireless Sensor Network (WSN) as per the latency requirements specified by Smart Grid (SG). To propose an algorithm for efficient data recovery mechanism so that ZigBee devices can quickly familiarize with the encoding according to the highly dynamic WiFi traffic. To propose an efficient frequency shifting mechanism for different frame sizes of data under interference conditions to guarantee the reliable data transmission within the delay requirements of the SG. To propose an effective mechanism to guarantee the ZigBee communications within the maximum tolerable delay under the coexistence of WiFi for carrying out effective smart home solutions. To propose an algorithm based on effective transmission power control to increase WSN life time under coexistence scenarios for efficient monitoring and controlling purposes at smart homes. With the introduction of Information and Data-Communication Technology (ICT) to the present electrical power systems, the traditional electrical-grid system is becoming more intelligent and adaptive. The ICT successfully establishes bi-directional communication between Utility companies and the consumer for improving the generation and utilization of power. Wireless Sensor Network (WSN) is efficiently utilized by wide-ranging Smart Grid (SG) applications. Despite many advantages, WSN faces a challenge of avoiding interference experiencing from other coexisting wireless technologies working in the 2.4GHz unlicensed frequency band. Providing support for WSN in terms of avoiding interference is a very challenging issue due to the dynamic wireless communication environment and extremely limited resources. In the present thesis, the problem of interference experienced by WSN in 2.4GHz has been investigated. The challenges, limitations and requirements for avoiding the interference for WSN working in the vicinity of other technologies like WiFi and Bluetooth have been identified. As a result of the literature survey carried out, it was identified that proper channel selection and channel prioritization for WSNs working in the coexisting environment had not been adequately developed till then. Hence, there was a requirement for addressing these issues. The proposed schemes in this thesis are based on simulation results obtained.*
