*Causes of Electromagnetic Radiation From Detonation of Conventional Explosives: A Literature Survey* Jun 19 2022 A literature survey was conducted on the presence of electromagnetic radiation from the detonation of conventional explosives. This survey is part of a technology effort to identify a useful battlefield signature that an individual soldier could detect. Sources reported observations of such signals in the range from as low as 0.5 Hz up to 2 GHz. Several of the investigators believed that the likeliest cause was charged particles created by ionization within the explosive region. The frequencies of the radiation appear related to the duration of shock waves and other hydrodynamic phenomena caused by the detonation. A calculation model presented in the literature provides estimates of frequency bands in this range and also of signal levels produced. The model is used to analyze some of the published results and provide some correlation between observations of several investigators.

**Process and Plant Safety** Dec 21 2019 Accidents in industrial installations are random events. Hence they cannot be totally avoided. Only the probability of their occurrence may be reduced and their consequences be mitigated. The book proceeds from hazards caused by materials and process conditions to indicating engineered and organizational measures for achieving the objectives of reduction and mitigation. Qualitative methods for identifying weaknesses of design and increasing safety as well as models for assessing accident consequences are presented. The quantitative assessment of the effectiveness of safety measures is explained. The treatment of uncertainties plays a role there. They stem from the random character of the accident and from lacks of knowledge of some of the phenomena to be addressed. The reader is acquainted with the simulation of accidents, with safety and risk analyses and learns how to judge the potential and limitations of mathematical modelling. Risk analysis is applied amongst others to "functional safety" and the determination of "appropriate distances" between industry and residential areas (land-use planning). This shows how it can be used as a basis for safety-relevant decisions. Numerous worked-out examples and case studies addressing real plants and situations deepen the understanding of the subjects treated and support self-study.
