Experimental Models of Epilepsy and Related Comorbidities Jul 08 2021 Epileptic patients live with epilepsy-associated complications such as cognitive dysfunction, psychological discomfort, and sexual function decline, and are more likely to experience emotional and mental health issues problems, including depression and anxiety. Many antiepileptic drugs are found to have a role in aggravating psychiatric symptoms. Animal models, which inform translational questions about epilepsy comorbidities, are used to study the relationship between epilepsy and related comorbidities. The aim of this Research Topic was to highlight basic, clinical and interdisciplinary research involved in studying the disease and its comorbid effects. Various experimental models are used to understand the mechanisms of disease and to discover newer antiepileptic drugs. These experimental models combines the input from behavioral, biochemical and molecular level including genetic.

Integrative Toxicogenomics: Analytical Strategies to Amalgamate Exposure Effects with Genomic Sciences Jan 22 2020 Toxicogenomics combines the use of toxicology and genomic sciences to elucidate chemical, toxic and environmental stressor effects on biological systems. Integrative toxicogenomics requires innovation in bioinformatics, statistics and systems toxicology and typically a combination of the utility of two or more of these disciplines to better understand molecular mechanisms involved in toxic responses. This *Frontiers in Toxicogenomics Research Topic eBook* focuses on integrative toxicogenomics more so at the late stage (analyzing each data set separately and then merging the results) and brings together analyses that combine gene expression (microarray, TempO-Seq or RNA-Seq) with other data (biological assays, clinical chemistry, therapeutic categories or molecular pathways) or highlights data analytics that leverage bioinformatics and statistics. The eight articles illustrate the state-of-art in the field and the analysis of toxicogenomics data for a more comprehensive deduction of biological mechanisms and cellular functions associated with adverse outcomes from environmental exposures, chemicals and toxicants. However, it is clear that the field of integrative toxicogenomics needs considerably more attention paid to it in order to develop other clever ways of integrating the data for analysis.

Stem Cell Bioprocessing and Manufacturing Sep 10 2021 The next healthcare

revolution will apply regenerative medicines using human cells and tissues. The aim of the regenerative medicine approach is to create biological therapies or substitutes in vitro for the replacement or restoration of tissue function in vivo lost through failure or disease. However, whilst science has revealed the potential, and early products have shown the power of such therapies, there is an immediate and long-term need for expertise with the necessary skills to face the engineering and life science challenges before the predicted benefits in human healthcare can be realized. Specifically, there is a need for the development of bioprocess technology for the successful transfer of laboratory-based practice of stem cell and tissue culture to the clinic as therapeutics through the application of engineering principles and practices. This Special Issue of Bioengineering on Stem Cell Bioprocessing and Manufacturing addresses the central role in defining the engineering sciences of cell-based therapies, by bringing together contributions from worldwide experts on stem cell biology and engineering, bioreactor design and bioprocess development, scale-up, and manufacturing of stem cell-based therapies.
